Competitive organizations everywhere are focusing on ways to regain control of the critical documents and data that drive their business. Yet choosing a document management system that best fits your organization is extremely complex in today's ever-changing business environment. If you are an Existing KoVis customer knowing what to do with the KoVis proprietary database can be a challenge. Maintaining it as a legacy system or migrating to a new system can be both time consuming and expensive. What if there was another way?

With File360 you can meet that challenge successfully. File360 provides a powerful, intuitive, and scalable document management system that enables your organization to rapidly capture, index, store, share, and protect your critical business documents regardless of the application used to create them and with seamless integration with the existing KoVis database.

File360 provides a trusted information foundation for any size organization. It supports the entire spectrum of unstructured content and data including scanned pages, faxes, files, emails and multimedia objects. File360 enables your organization to regain control over your critical information, improve the quality of your business decisions, and increase operational and process efficiency.

### ***Seamless Integration with KoVis***

File360 has been designed with the existing KoVis user in mind and will enable your organization to rapidly create an environment for immediate data sharing and access, without the restrictions imposed by the current KoVis database structure and, without the need for an expensive and time consuming migration project, the result? A dramatic cost saving for upgrading every KoVis client on your network.

The modular design allows you to install only the features your organization needs today, yet easily add capabilities in the future. Furthermore, a host of APIs and Web Services allow customers to integrate document management functions directly into business and workflow applications.

File360's open design and architecture uses the power of Microsoft Windows® Server platform and supports the most popular database packages, including native connections to Microsoft SQL Server® and Oracle® Database. For organizations leveraging the power of Microsoft SharePoint®, File360 offers Web Parts that enable access to the existing and new document repositories.
